NUTAN PRABHAT

Software Engineer | Backend · Python · Django · REST APIs · SQL · Retrieval · Claude Code

Pune, India · +91 7004841336 · prabhat9819@gmail.com

nutanprabhat.dev · linkedin.com/in/nutan-prabhat · github.com/epicallyunreal

PROFESSIONAL SUMMARY

Software engineer with 4+ years building and owning backend and full-stack systems in Python and C#. At Aziro I worked directly with an enterprise client as sole engineer and raised a retrieval system's Top-1 accuracy from 41.9% to 97.7%. At Zenoti, on a 500+ page multi-tenant SaaS product used by 30,000+ businesses, I worked on UI revamp, added an integration layer to localization and restored degraded SQL queries. I build with Claude Code daily and am learning agents and RAG with LangChain and LangGraph. Looking for forward deployed and backend roles.

TECHNICAL SKILLS

Languages: Python, C#, C++, JavaScript, SQL

Backend: Django, Django REST Framework, ASP.NET, REST API design, System design (HLD/LLD), Data structures & algorithms, ETL & data pipelines, Localization (i18n)

Databases: PostgreSQL, MySQL, Microsoft SQL Server, Elasticsearch, Stored procedures, SQL query optimization

AI: Vector DB, Retrieval, CLIP (ViT-B/16), Qdrant, Similarity search, Reranking, PyTorch - learning LLMs and RAG with LangChain, Pydantic and LangGraph agents

Cloud & DevOps: Docker, CI/CD, Google Cloud, Git, GitHub, GitHub Actions

Testing: Pytest, Postman, Code review

Frontend: React, TypeScript, jQuery, HTML5, CSS3, Tailwind CSS, Vite

AI-Assisted Development: Claude, Claude Code, GitHub Copilot - spec-driven, agentic build workflows

Also worked with: Unity, PySide6 / Qt

WORK EXPERIENCE

Senior Software Engineer - Aziro (formerly MSys Technologies) Dec 2025 – Oct 2026

- Sole engineer on an enterprise client account, owning scoping, HLD/LLD, build, test, documentation and handover.
- Raised Top-1 accuracy of a two-stage visual retrieval system from 41.9% to 97.7% by growing the feature-based reranker from 3 to 8 features and tuning it against MRR, with CLIP ViT-B/16 embeddings in Qdrant handling recall.
- Delivered a config-driven Python desktop CAD validation platform end to end, with DXF parsing, 2D computational geometry, spatial indexing, a PySide6 interface and an integration with the client's system, plus one-click batch processing across multiple folders.
- Automated 3+ manual workflows by building a JSON rule engine that binds validation rules to check and fix functions at runtime, with priority-ordered execution and full audit trails.
- Replaced the manual creation of CAD file variations by building rule-based geometry augmentation that generates controlled variations of each file and heals the 2D geometry after every change.
- Kept both platforms configuration-driven, so new categories, thresholds and weights go in through JSON.

Co-Founder & Game Developer - UnKl Games Jun 2024 – Dec 2025

- Reached 10K+ downloads on Google Play and 500+ monthly active players with no paid ads by building and shipping Pen Fight 2D, a turn-based multiplayer mobile game in Unity and C#, end to end.
- Built a server-authoritative economy in server-side JavaScript on Unity Cloud Code, covering shop, assets, upgrades, a progression chart and notifications.
- Architected online multiplayer and friend challenges on Unity Lobby and Relay.
- Built a master-follower physics simulation that handles race conditions on nearly every action.
- Architected race-safe match negotiation with a single start authority, turn timers, disconnect forfeits and version gating.
- Integrated Google Cloud for authentication and APIs, plus Unity Cloud Save for account and progress sync.
- Designed the fix for a cross-device desync from resolution-dependent UI scaling, sending normalised coordinates over the wire.
- Ran the full release cycle, from internal test tracks and feedback fixes to production rollout and updates.

Software Engineer - Zenoti Aug 2022 – May 2024

- Flagged 40+ would-be defects as primary code reviewer, reached in just over a year, requesting changes on 25+ of 50+ PRs including senior-approved work, and mentored teammates on defect resolution.
- Designed and owned a localization integration layer in JavaScript and C# that launched with 5+ languages, including French and Canadian French, with providers switchable by configuration, per-element opt-out and coverage through the API and database layers.
- Restored SQL queries degraded 2 to 3x to near-baseline response times with no downtime, by adding an index and gating a stored procedure's longer path behind a setting.
- Removed a data-loss risk by rewriting legacy stored procedures, one of them 4,000 lines, replacing a destructive save that deleted and re-inserted every row with differential updates.
- Migrated the highest-complexity pages of a large ASP.NET C# codebase to jQuery 3.5+, contributing refactor patterns adopted into shared libraries.
- Extended Elasticsearch type-ahead search with minimum-character filtering and query tuning.

Software Engineer Intern - Zenoti Feb 2022 – Aug 2022

- Contributed production frontend changes across a full UI redesign in HTML, SCSS, jQuery and ASPX.
- Unlocked a major account by extending a hierarchical permission model so a previously passive intermediate tier could control multiple entity types, delivered as a 2-week proof of concept.
- Provided post-patch production support and resolved high-priority escalations.

PROJECTS

XpenseSplitter Aug 2026

split.nutanprabhat.dev · github.com/epicallyunreal/XpenseSplitter

A shared expense splitter for group trips, fully client-side React with no backend, no accounts and no database. A trip lives in the browser and travels as a JSON file, or as a link that carries the whole trip inside it.

- Chronological ledger: amount, category, payment type, who paid, and exactly who splits it.
- Who owes what, settled two ways: every pairwise debt, or the fewest transfers that clear it.
- A trip shares as a link that carries it, so no account, nothing uploaded, nothing to expire.

Portfolio Aug 2026

nutanprabhat.dev · github.com/epicallyunreal/Portfolio

A React and TypeScript site where two JSON files are the only source of truth. The build derives the site, the CV PDF, the Open Graph image, sitemap and HTML head from them, and CI blocks content that doesn't hold together.

- One validator backs the CLI, the pre-commit hook and the editor, so all three agree by construction.
- Site and Calibri-metric CV PDF render from the same JSON, printed by Puppeteer against a hidden route.
- In-browser editor writes files locally and exports downloadable JSON when deployed, with no write path.

CreatorHub May 2026

github.com/epicallyunreal/CreatorHub

Personal multi-tenant Django and React platform for creator agencies, covering tenancy, identity, campaign lifecycle and payouts. I designed the modules and data models and directed the build in Claude Code. It isn't deployed.

- Architected a 12-app module structure separating tenancy, identity, campaigns and billing concerns.
- Designed dual-actor JWT authentication and role-based access control with per-user grant and deny overrides.
- Designed an 11-stage forward-only campaign lifecycle with audit trail and milestone-based approvals.

BGMI Tournament Management System Nov 2024 – Dec 2024

epicallyunreal.github.io/bgmileaderboard · github.com/epicallyunreal/bgmileaderboard

Django and PostgreSQL tournament platform with UI-driven CRUD, custom leaderboard generation and JSON export, plus a static JavaScript frontend serving a public leaderboard with no hosting cost.

- Implemented leaderboard generation logic and JSON export as the deployment boundary.
- Rebuilt sorting, filtering and search client-side to remove the need for a hosted backend.

LittleLemon API Oct 2023 – Dec 2023

github.com/epicallyunreal/LittleLemon

Django REST Framework API covering models, serializers, endpoints, and authentication with Djoser.

- Built full CRUD endpoints with role-scoped permissions and token authentication.

Handwritten Text Recognition Jul 2021 – Aug 2021

PyTorch character recognition trained on the IAM handwriting dataset, covering preprocessing through training and evaluation.

- Implemented the preprocessing, training and evaluation pipeline end to end.

EDUCATION

MCA, Computer Applications - Vellore Institute of Technology (2020 – 2022) · GPA 8.74/10

B.Sc., Information Technology - St. Xavier's College, Ranchi (2017 – 2020) · GPA 8.26/10

ACHIEVEMENTS

- **HackerRank Orchestrate, October 2026: rank 176 of 4,094 (top 5%) in a 24-hour AI agent hackathon**. HackerRank's 24-hour challenge asked for an AI agent that works out whether a company really deleted someone's data, scored across 518 requests, using logs, database snapshots, PDFs and screenshots. The submission combined a deterministic audit engine with Claude reading free-text requests in several languages, PDFs and screenshots, and a critic reviewing every finished answer. The critic caught 76 of 79 seeded faults, and 10 held-out samples, never opened, scored 0.848 against 0.851 on development samples. Built with Claude Code, with four reviewer agents at each stage. Model cost for the final run was about $16.
- **HackerRank Orchestrate, September 2026: rank 224 of 3,062 (top 8%) in a 24-hour AI agent hackathon**. HackerRank's 24-hour challenge asked for an AI agent that decides whether someone can safely afford a purchase, scored across 250 requests. The submission combined a deterministic 90-day cash-flow engine, including a verifier that re-simulated every recommendation, with Claude reading 16 receipts and payslips and classifying 215 messages in two languages. Eight tagged versions each tested one hypothesis against 25 solved examples. Model cost for the full run was about $3.
- **HackerRank 5-star: Python, SQL, C++** (2024)
- **CodeChef, peak rating 1692 across 73 contests** (2024)
